## **BACKGROUND OF THE INVENTION**

## **Technical Field**

[0001]

The present invention relates, generally, to systems and methods for remote viewing and, more particularly, to a password-protected system which acquires and transmits patient images to a server for remote access via the Internet.

## **Background Invention**

[0002]

A medical facility typically requires physician input to determine the most appropriate medical care for the patient. However, requiring a physician to be present 24 hours a day at the medical facility to examine the patient, or a radiological image of the patient, may be inefficient and expensive. Particularly, a medical facility may not have the financial resources or patient volume to support a physician on site at all times; the medical facility may be located in a remote location; or a town may not have a sufficient number of physicians available to be located at each medical facility at all times of the day. As such, when a patient requires medical attention, an experienced physician may not be readily available at a particular medical facility.

[0003]

Accordingly, a system is needed which acquires an image of a patient and transmits the image to a remote location for viewing and analysis by an experienced physician. While prior art teleradiology systems exist which establish a direct communication link to a remote location and transmit radiological images to the
